DRV8871 3.6-A Brushed DC Motor Driver With Internal Current Sense (PWM Control)

1 Features

- H-Bridge Motor Driver
  - Drives One DC Motor, One Winding of a Stepper Motor, or Other Loads
- Wide 6.5-V to 45-V Operating Voltage
- 565-mΩ Typical $R_{DS(on)}$ (HS + LS)
- 3.6-A Peak Current Drive
- PWM Control Interface
- Current Regulation Without a Sense Resistor
- Low-Power Sleep Mode
- Small Package and Footprint
  - 8-Pin HSOP With PowerPAD™
  - 4.9 × 6 mm
- **Integrated Protection Features**
  - VM Undervoltage Lockout (UVLO)
  - Overcurrent Protection (OCP)
  - Thermal Shutdown (TSD)
  - Automatic Fault Recovery

2 Applications

- Printers
- Appliances
- Industrial Equipment
- Other Mechatronic Applications

3 Description

The DRV8871 device is a brushed-DC motor driver for printers, appliances, industrial equipment, and other small machines. Two logic inputs control the H-bridge driver, which consists of four N-channel MOSFETs that can control motors bidirectionally with up to 3.6-A peak current. The inputs can be pulse-width modulated (PWM) to control motor speed, using a choice of current-decay modes. Setting both inputs low enters a low-power sleep mode.

The DRV8871 device has advanced current-regulation circuitry that does not use an analog voltage reference or external sense resistor. This novel solution uses a standard low-cost, low-power resistor to set the current threshold. The ability to limit current to a known level can significantly reduce the system power requirements and bulk capacitance needed to maintain stable voltage, especially for motor startup and stall conditions.

The device is fully protected from faults and short circuits, including undervoltage (UVLO), overcurrent (OCP), and overtemperature (TSD). When the fault condition is removed, the device automatically resumes normal operation.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
DRV8871	HSOP (8)	4.90 mm × 6.00 mm

4 Revision History

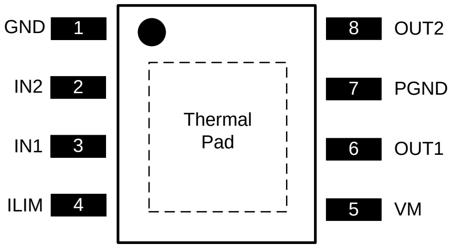
NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision A (January 2016) to Revision B	**Page**
• Deleted the power supply voltage ramp rate (VM) parameter from the *Absolute Maximum Ratings* table	3
• Added the output current parameter to the *Absolute Maximum Ratings* table	3
• Added the *Receiving Notification of Documentation Updates* section	17

Changes from Original (August 2015) to Revision A	**Page**
• Updated the f_{PWM} max value and added a note	4
• Removed the redundant T_A condition and added f_{PWM} = 24 kHz	5
• Added more information to clarify how the max RMS current varies for different applications	12

5 Pin Configuration and Functions

DDA Package
8-Pin HSOP
Top View



Pin Functions

PIN		TYPE	DESCRIPTION	
NAME	NO.			
GND	1	PWR	Logic ground	Connect to board ground
ILIM	4	I	Current limit control	Connect a resistor to ground to set the current chopping threshold
IN1	3	I	Logic inputs	Controls the H-bridge output. Has internal pulldowns (see Table 1).
IN2	2			
OUT1	6	O	H-bridge output	Connect directly to the motor or other inductive load.
OUT2	8			
PGND	7	PWR	High-current ground path	Connect to board ground.
VM	5	PWR	6.5-V to 45-V power supply	Connect a 0.1-µF bypass capacitor to ground, as well as sufficient bulk capacitance, rated for the VM voltage.
PAD	—	—	Thermal pad	Connect to board ground. For good thermal dissipation, use large ground planes on multiple layers, and multiple nearby vias connecting those planes.

6 Specifications

6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)(1)

	MIN	MAX	UNIT
Power supply voltage (VM)	–0.3	50	V
Logic input voltage (IN1, IN2)	–0.3	7	V
Continuous phase node pin voltage (OUT1, OUT2)	–0.7	VM + 0.7	V
Output current (100% duty cycle)	0	3.5	A
Operating junction temperature, T_J	–40	150	°C
Storage temperature, T_{stg}	–65	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±6000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±750	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	MAX	UNIT
VM	Power supply voltage	6.5	45	V
V_I	Logic input voltage (IN1, IN2)	0	5.5	V
f_{PWM}	Logic input PWM frequency (IN1, IN2)	0	200(1)	kHz
I_{peak}	Peak output current(2)	0	3.6	A
T_A	Operating ambient temperature(2)	–40	125	°C

(1) The voltages applied to the inputs should have at least 800 ns of pulse width to ensure detection. Typical devices require at least 400 ns. If the PWM frequency is 200 kHz, the usable duty cycle range is 16% to 84%.
(2) Power dissipation and thermal limits must be observed

6.4 Thermal Information

THERMAL METRIC(1)		DRV8871	UNIT
		DDA (HSOP)	
		8 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	41.1	°C/W
$R_{\theta JC(top)}$	Junction-to-case (top) thermal resistance	53.1	°C/W
$R_{\theta JB}$	Junction-to-board thermal resistance	23.1	°C/W
ψ_{JT}	Junction-to-top characterization parameter	8.2	°C/W
ψ_{JB}	Junction-to-board characterization parameter	23	°C/W
$R_{\theta JC(bot)}$	Junction-to-case (bottom) thermal resistance	2.7	°C/W

(1) For more information about traditional and new thermal metrics, see the *Semiconductor and IC Package Thermal Metrics* application report.

6.5 Electrical Characteristics

T_A = 25°C, over recommended operating conditions (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
POWER SUPPLY (VM)						
VM	VM operating voltage		6.5		45	V
I_{VM}	VM operating supply current	VM = 12 V		3	10	mA
$I_{VMSLEEP}$	VM sleep current	VM = 12 V			10	µA
t_{ON} (1)	Turn-on time	VM > V_{UVLO} with IN1 or IN2 high		40	50	µs
LOGIC-LEVEL INPUTS (IN1, IN2)						
V_{IL}	Input logic low voltage				0.5	V
V_{IH}	Input logic high voltage		1.5			V
V_{HYS}	Input logic hysteresis			0.5		V
I_{IL}	Input logic low current	V_{IN} = 0 V	–1		1	µA
I_{IH}	Input logic high current	V_{IN} = 3.3 V		33	100	µA
R_{PD}	Pulldown resistance	To GND		100		kΩ
t_{PD}	Propagation delay	INx to OUTx change (see Figure 6)		0.7	1	µs
t_{sleep}	Time to sleep	Inputs low to sleep		1	1.5	ms
MOTOR DRIVER OUTPUTS (OUT1, OUT2)						
$R_{DS(ON)}$	High-side FET on resistance	VM = 24 V, I = 1 A, f_{PWM} = 25 kHz		307	360	mΩ
$R_{DS(ON)}$	Low-side FET on resistance	VM = 24 V, I = 1 A, f_{PWM} = 25 kHz		258	320	mΩ
t_{DEAD}	Output dead time			220		ns
V_d	Body diode forward voltage	I_{OUT} = 1 A		0.8	1	V
CURRENT REGULATION						
V_{ILIM}	Constant for calculating current regulation (see Equation 1)	I_{OUT} = 1 A	59	64	69	kV
t_{OFF}	PWM off-time			25		µs
t_{BLANK}	PWM blanking time			2		µs
PROTECTION CIRCUITS						
V_{UVLO}	VM undervoltage lockout	VM falls until UVLO triggers		6.1	6.4	V
		VM rises until operation recovers		6.3	6.5	
$V_{UV,HYS}$	VM undervoltage hysteresis	Rising to falling threshold	100	180		mV
I_{OCP}	Overcurrent protection trip level		3.7	4.5	6.4	A
t_{OCP}	Overcurrent deglitch time			1.5		µs
t_{RETRY}	Overcurrent retry time			3		ms
T_{SD}	Thermal shutdown temperature		150	175		°C
T_{HYS}	Thermal shutdown hysteresis			40		°C

(1) t_{ON} applies when the device initially powers up, and when it exits sleep mode.

6.6 Typical Characteristics

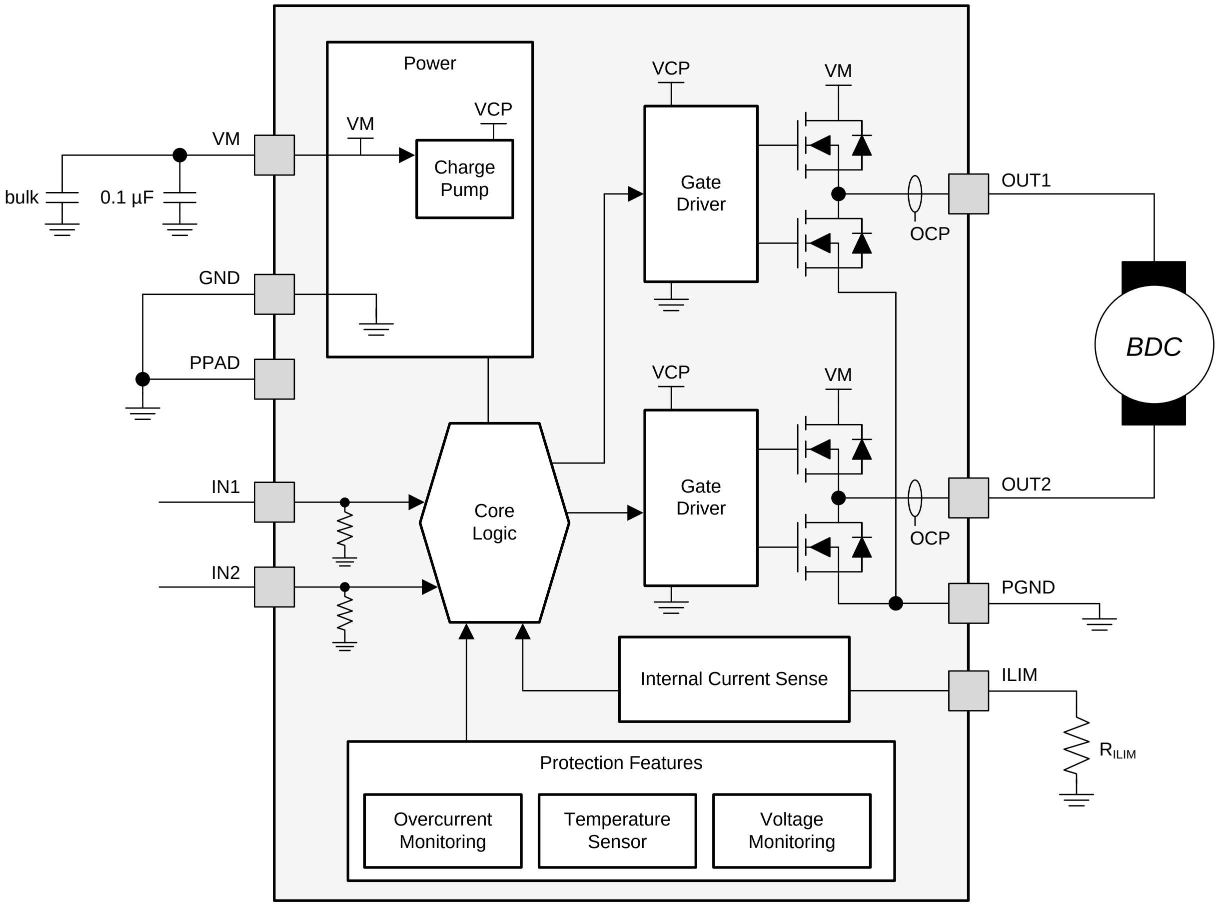
7 Detailed Description

7.1 Overview

The DRV8871 device is an optimized 8-pin device for driving brushed DC motors with 6.5 to 45 V and up to 3.6-A peak current. The integrated current regulation restricts motor current to a predefined maximum. Two logic inputs control the H-bridge driver, which consists of four N-channel MOSFETs that have a typical $R_{ds(on)}$ of 565 mΩ (including one high-side and one low-side FET). A single power input, VM, serves as both device power and the motor winding bias voltage. The integrated charge pump of the device boosts VM internally and fully enhances the high-side FETs. Motor speed can be controlled with pulse-width modulation, at frequencies between 0 to 100 kHz. The device has an integrated sleep mode that is entered by bringing both inputs low. An assortment of protection features prevent the device from being damaged if a system fault occurs.

7.2 Functional Block Diagram



7.3 Feature Description

7.3.1 Bridge Control

The DRV8871 output consists of four N-channel MOSFETs that are designed to drive high current. They are controlled by the two logic inputs IN1 and IN2, according to Table 1.

Table 1. H-Bridge Control

IN1	IN2	OUT1	OUT2	DESCRIPTION
0	0	High-Z	High-Z	Coast; H-bridge disabled to High-Z (sleep entered after 1 ms)
0	1	L	H	Reverse (Current OUT2 → OUT1)
1	0	H	L	Forward (Current OUT1 → OUT2)
1	1	L	L	Brake; low-side slow decay

The inputs can be set to static voltages for 100% duty cycle drive, or they can be pulse-width modulated (PWM) for variable motor speed. When using PWM, it typically works best to switch between driving and braking. For example, to drive a motor forward with 50% of its max RPM, IN1 = 1 and IN2 = 0 during the driving period, and IN1 = 1 and IN2 = 1 during the other period. Alternatively, the coast mode (IN1 = 0, IN2 = 0) for *fast current decay* is also available. The input pins can be powered before VM is applied.

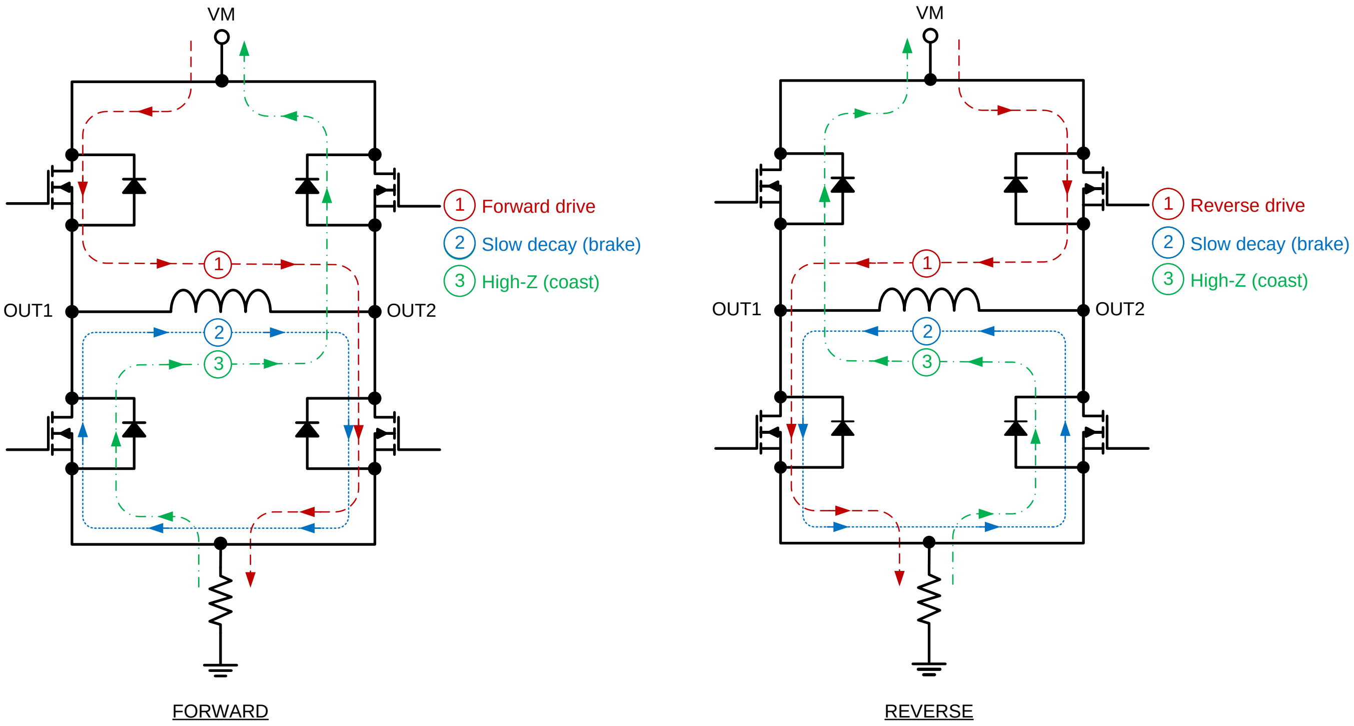


Figure 4. H-Bridge Current Paths

7.3.2 Sleep Mode

When IN1 and IN2 are both low for time t_{SLEEP} (typically 1 ms), the DRV8871 device enters a low-power sleep mode, where the outputs remain High-Z and the device uses $I_{VMSLEEP}$ (microamps) of current. If the device is powered up while both inputs are low, sleep mode is immediately entered. After IN1 or IN2 are high for at least 5 µs, the device will be operational 50 µs (t_{ON}) later.

7.3.3 Current Regulation

The DRV8871 device limits the output current based on a standard resistor attached to pin ILIM, according to this equation:

$$I_{TRIP}\ (A) = \frac{V_{ILIM}\ (kV)}{R_{ILIM}\ (k\Omega)} = \frac{64\ (kV)}{R_{ILIM}\ (k\Omega)} \quad (1)$$

For example, if R_{ILIM} = 32 kΩ, the DRV8871 device limits motor current to 2 A no matter how much load torque is applied. The minimum allowed R_{ILIM} is 15 kΩ. System designers should always understand the min and max I_{TRIP}, based on the R_{ILIM} resistor component tolerance and the DRV8871 specified V_{ILIM} range.

When I_{TRIP} has been reached, the device enforces slow current decay by enabling both low-side FETs, and it does this for time t_{OFF} (typically 25 µs).

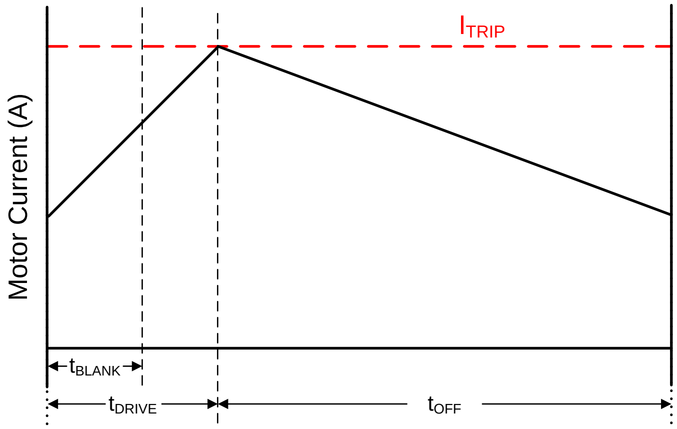

Figure 5. Current Regulation Time Periods

After t_{OFF} has elapsed, the output is re-enabled according to the two inputs INx. The drive time (t_{DRIVE}) until reaching another I_{TRIP} event heavily depends on the VM voltage, the motor's back-EMF, and the motor's inductance.

7.3.4 Dead Time

When an output changes from driving high to driving low, or driving low to driving high, dead time is automatically inserted to prevent shoot-through. t_{DEAD} is the time in the middle when the output is High-Z. If the output pin is measured during t_{DEAD}, the voltage will depend on the direction of current. If current is leaving the pin, the voltage will be a diode drop below ground. If current is entering the pin, the voltage will be a diode drop above VM. This diode is the body diode of the high-side or low-side FET.

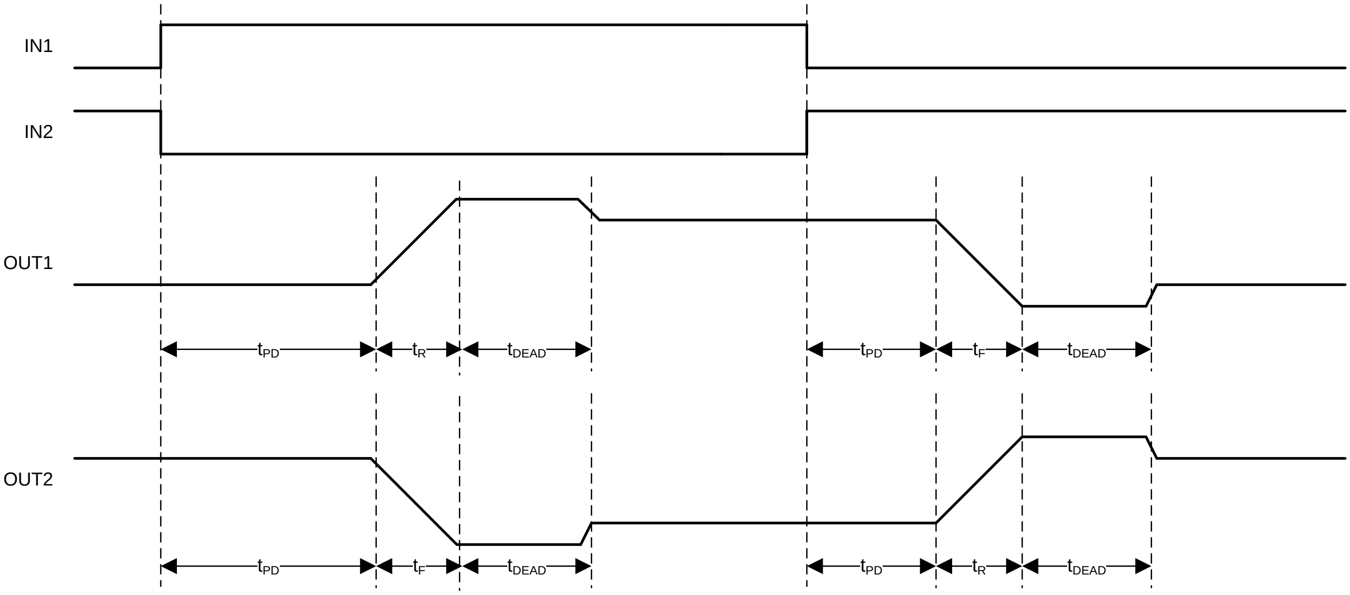

Figure 6. Propagation Delay Time

7.3.5 Protection Circuits

The DRV8871 device is fully protected against VM undervoltage, overcurrent, and overtemperature events.

7.3.5.1 VM Undervoltage Lockout (UVLO)

If at any time the voltage on the VM pin falls below the undervoltage lockout threshold voltage, all FETs in the H-bridge will be disabled. Operation will resume when VM rises above the UVLO threshold.

7.3.5.2 Overcurrent Protection (OCP)

If the output current exceeds the OCP threshold I_{OCP} for longer than t_{OCP}, all FETs in the H-bridge are disabled for a duration of t_{RETRY}. After that, the H-bridge will be re-enabled according to the state of the INx pins. If the overcurrent fault is still present, the cycle repeats; otherwise normal device operation resumes.

7.3.5.3 Thermal Shutdown (TSD)

If the die temperature exceeds safe limits, all FETs in the H-bridge will be disabled. After the die temperature has fallen to a safe level, operation automatically resumes.

Table 2. Protection Functionality

FAULT	CONDITION	H-BRIDGE BECOMES	RECOVERY
VM undervoltage lockout (UVLO)	VM < V_{UVLO}	Disabled	VM > V_{UVLO}
Overcurrent (OCP)	$I_{OUT} > I_{OCP}$	Disabled	t_{RETRY}
Thermal Shutdown (TSD)	T_J > 150°C	Disabled	$T_J < T_{SD} – T_{HYS}$

7.4 Device Functional Modes

The DRV8871 device can be used in multiple ways to drive a brushed DC motor.

7.4.1 PWM With Current Regulation

This scheme uses all of the device's capabilities. I_{TRIP} is set above the normal operating current, and high enough to achieve an adequate spin-up time, but low enough to constrain current to a desired level. Motor speed is controlled by the duty cycle of one of the inputs, while the other input is static. Brake/slow decay is typically used during the off-time.

7.4.2 PWM Without Current Regulation

If current regulation is not needed, a 15-kΩ to 18-kΩ resistor should be used on pin ILIM. This mode provides the highest possible peak current: up to 3.6 A for a few hundred milliseconds (depending on PCB characteristics and the ambient temperature). If current exceeds 3.6 A, the device might reach overcurrent protection (OCP) or overtemperature shutdown (TSD). If that happens, the device disables and protects itself for about 3 ms (t_{RETRY}) and then resumes normal operation.

7.4.3 Static Inputs With Current Regulation

IN1 and IN2 can be set high and low for 100% duty cycle drive, and I_{TRIP} can be used to control the current, speed, and torque capability of the motor.

7.4.4 VM Control

In some systems it is desirable to vary VM as a means of changing motor speed. See *Motor Voltage* for more information.

8 Application and Implementation

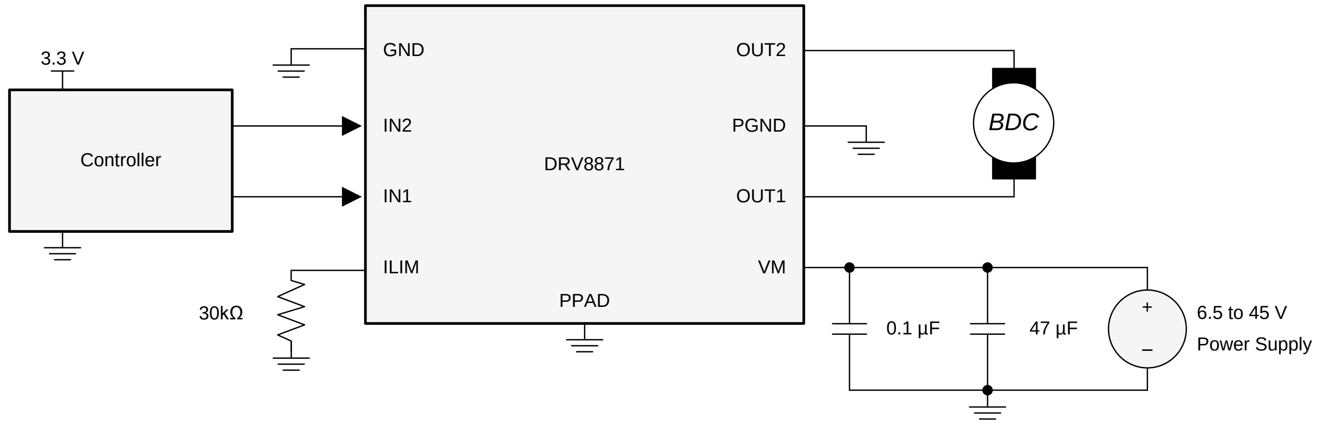
NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

8.1 Application Information

The DRV8871 device is typically used to drive one brushed DC motor.

8.2 Typical Application



Copyright © 2016, Texas Instruments Incorporated

Figure 7. Typical Connections

8.2.1 Design Requirements

Table 3 lists the design parameters.

Table 3. Design Parameters

DESIGN PARAMETER	REFERENCE	EXAMPLE VALUE
Motor voltage	V_M	24 V
Motor RMS current	I_{RMS}	0.8 A
Motor startup current	I_{START}	2 A
Motor current trip point	I_{TRIP}	2.1 A
ILIM resistance	R_{ILIM}	30 kΩ
PWM frequency	f_{PWM}	5 kHz

8.2.2 Detailed Design Procedure

8.2.2.1 Motor Voltage

The motor voltage to use will depend on the ratings of the motor selected and the desired RPM. A higher voltage spins a brushed DC motor faster with the same PWM duty cycle applied to the power FETs. A higher voltage also increases the rate of current change through the inductive motor windings.

8.2.2.2 Drive Current

The current path is through the high-side sourcing DMOS power driver, motor winding, and low-side sinking DMOS power driver. Power dissipation losses in one source and sink DMOS power driver are shown in the following equation.

$$P_D = I^2 \left(R_{DS(on)Source} + R_{DS(on)Sink}\right) \tag{2}$$

The DRV8871 device has been measured to be capable of 2-A RMS current at 25°C on standard FR-4 PCBs. The max RMS current varies based on the PCB design, ambient temperature, and PWM frequency. Typically, switching the inputs at 200 kHz compared to 20 kHz causes 20% more power loss in heat.

9 Power Supply Recommendations

9.1 Bulk Capacitance

Having appropriate local bulk capacitance is an important factor in motor drive system design. In general, having have more bulk capacitance is beneficial, while the disadvantages are increased cost and physical size.

The amount of local capacitance needed depends on a variety of factors, including:

- The highest current required by the motor system
- The power supply's capacitance and ability to source current
- The amount of parasitic inductance between the power supply and motor system
- The acceptable voltage ripple
- The type of motor used (brushed DC, brushless DC, stepper)
- The motor braking method

The inductance between the power supply and motor drive system will limit the rate current can change from the power supply. If the local bulk capacitance is too small, the system reponds to excessive current demands or dumps from the motor with a change in voltage. When adequate bulk capacitance is used, the motor voltage remains stable and high current can be quickly supplied.

The data sheet generally provides a recommended value, but system-level testing is required to determine the appropriate sized bulk capacitor.

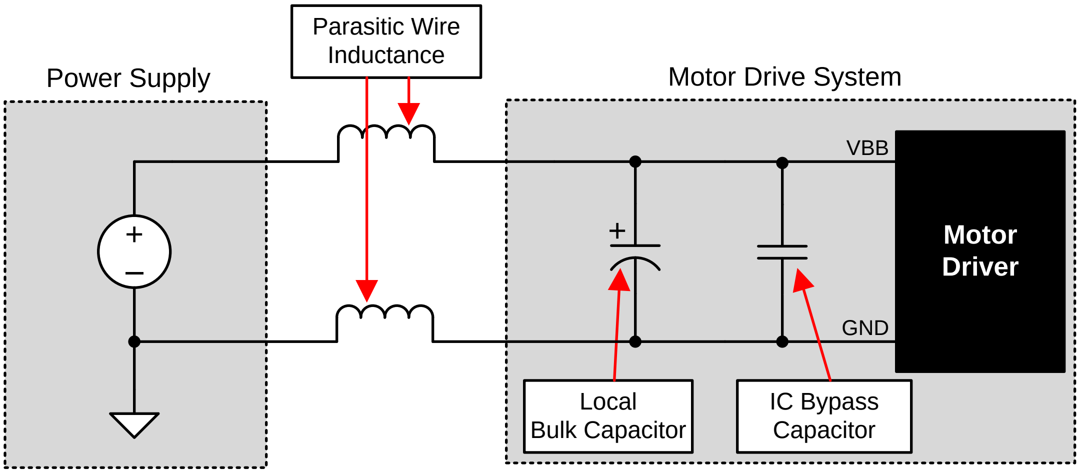

Figure 14. Example Setup of Motor Drive System With External Power Supply

The voltage rating for bulk capacitors should be higher than the operating voltage, to provide margin for cases when the motor transfers energy to the supply.

10 Layout

10.1 Layout Guidelines

The bulk capacitor should be placed to minimize the distance of the high-current path through the motor driver device. The connecting metal trace widths should be as wide as possible, and numerous vias should be used when connecting PCB layers. These practices minimize inductance and allow the bulk capacitor to deliver high current.

Small-value capacitors should be ceramic, and placed closely to device pins.

The high-current device outputs should use wide metal traces.

The device thermal pad should be soldered to the PCB top-layer ground plane. Multiple vias should be used to connect to a large bottom-layer ground plane. The use of large metal planes and multiple vias help dissipate the $I^2 \times R_{DS(on)}$ heat that is generated in the device.

10.2 Layout Example

Recommended layout and component placement is shown in Figure 15

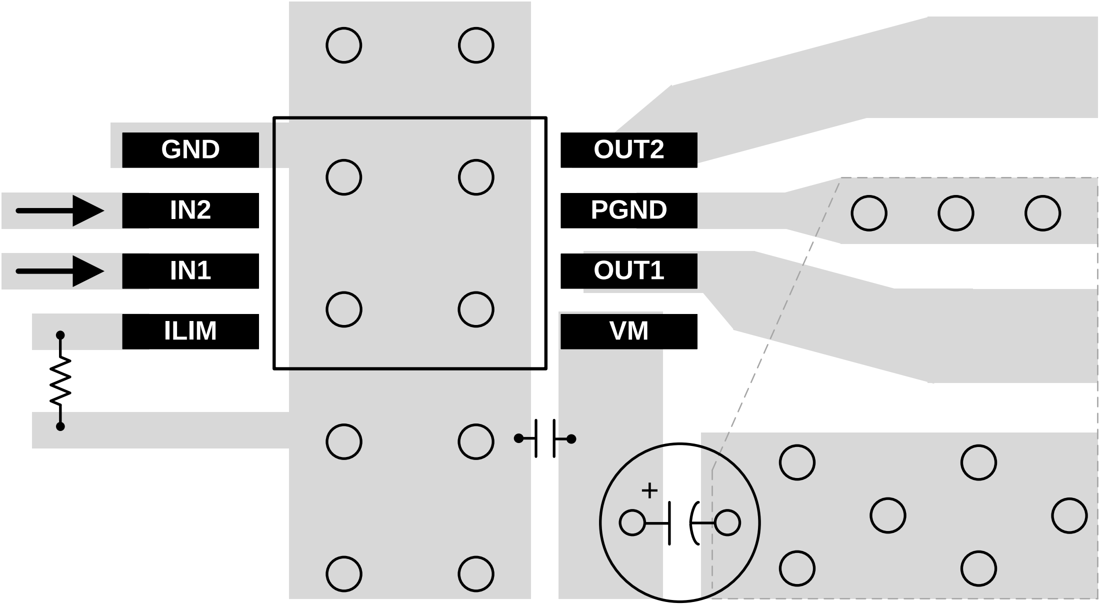

Figure 15. Layout Recommendation

10.3 Thermal Considerations

The DRV8871 device has thermal shutdown (TSD) as described in the *Thermal Shutdown (TSD)* section. If the die temperature exceeds approximately 175°C, the device is disabled until the temperature drops below the temperature hysteresis level.

Any tendency of the device to enter TSD is an indication of either excessive power dissipation, insufficient heatsinking, or too high of an ambient temperature.

10.4 Power Dissipation

Power dissipation in the DRV8871 device is dominated by the power dissipated in the output FET resistance, $R_{DS(on)}$. Use the equation in the *Drive Current* section to calculate the estimated average power dissipation when driving a load.

Note that at startup, the current is much higher than normal running current; this peak current and its duration must be also be considered.

Power Dissipation (continued)

The maximum amount of power that can be dissipated in the device is dependent on ambient temperature and heatsinking.

NOTE

$R_{DS(on)}$ increases with temperature, so as the device heats, the power dissipation increases. This fact must be taken into consideration when sizing the heatsink.

The power dissipation of the DRV8871 device is a function of RMS motor current and the FET resistance ($R_{DS(ON)}$) of each output.

$$\text{Power} \approx I_{RMS}^{2} \times \left(\text{High-side } R_{DS(ON)} + \text{ Low-side } R_{DS(ON)}\right) \quad (3)$$

For this example, the ambient temperature is 58°C, and the junction temperature reaches 80°C. At 58°C, the sum of $R_{DS(ON)}$ is about 0.72 Ω. With an example motor current of 0.8 A, the dissipated power in the form of heat will be $0.8\ A^2 \times 0.72\ \Omega = 0.46\ W$.

The temperature that the DRV8871 device reaches depends on the thermal resistance to the air and PCB. It is important to solder the device PowerPAD to the PCB ground plane, with vias to the top and bottom board layers, in order dissipate heat into the PCB and reduce the device temperature. In the example used here, the DRV8871 device had an effective thermal resistance $R_{\theta JA}$ of 48°C/W, and:

$$T_J = T_A + (P_D \times R_{\theta JA}) = 58°C + (0.46\ W \times 48°C/W) = 80°C \quad (4)$$

10.4.1 Heatsinking

The PowerPAD package uses an exposed pad to remove heat from the device. For proper operation, this pad must be thermally connected to copper on the PCB to dissipate heat. On a multi-layer PCB with a ground plane, this connection can be accomplished by adding a number of vias to connect the thermal pad to the ground plane.

On PCBs without internal planes, a copper area can be added on either side of the PCB to dissipate heat. If the copper area is on the opposite side of the PCB from the device, thermal vias are used to transfer the heat between top and bottom layers.

For details about how to design the PCB, refer to the TI application report, *PowerPAD™ Thermally Enhanced Package*, and the TI application brief, *PowerPAD Made Easy™*, available at www.ti.com. In general, the more copper area that can be provided, the more power can be dissipated.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as “components”) are sold subject to TI’s terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI’s terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers’ products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers’ products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI’s goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or “enhanced plastic” are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have ***not*** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
